

Soilborne plant pathogen dispersal and assessment: Building a remote sensing-based global surveillance system for plant disease

Katie Gold, Cornell University

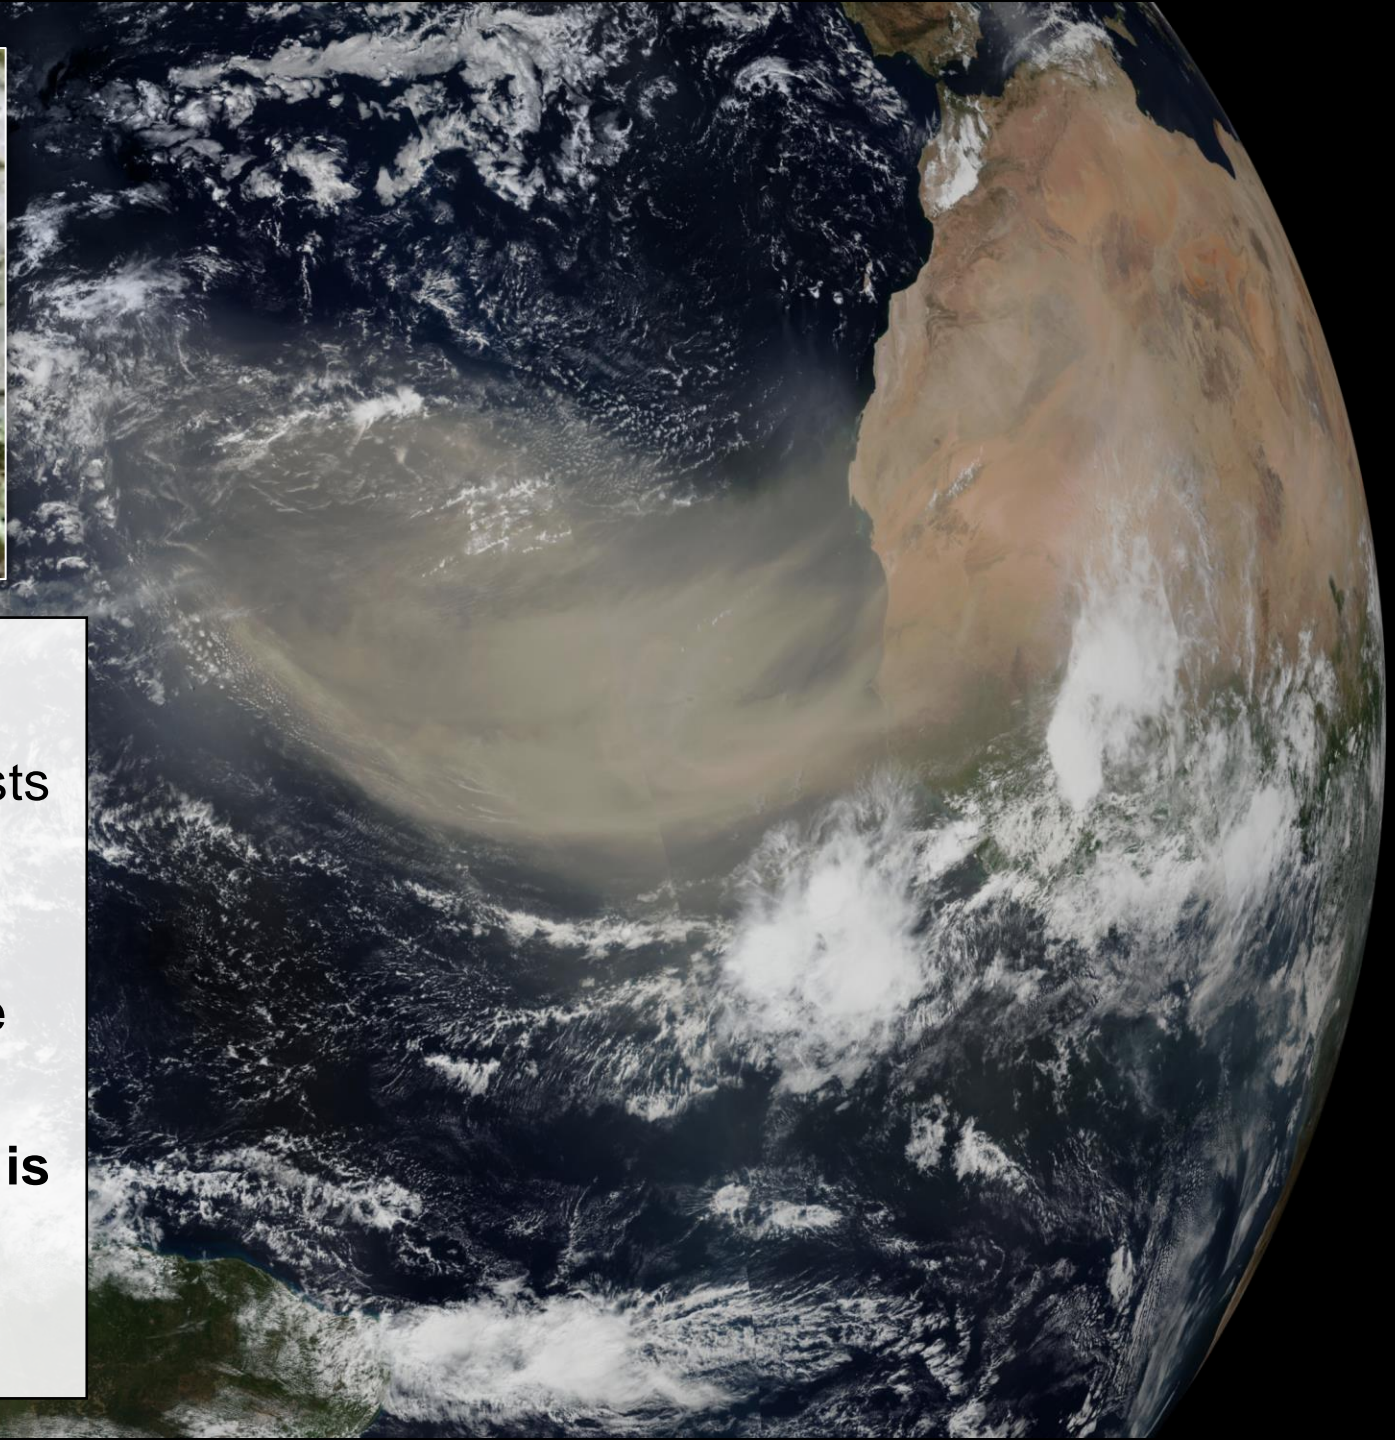

Rocio Calderón, Hannah Brodsky, Jaclyn Eller (CSUN), Andrew Miles (PSU),
Natalie Mahowald, Sharifa Crandall (PSU), and Ryan Pavlick (JPL)
NASA ROSES Interdisciplinary Sciences Grant #80NSSC20K1533

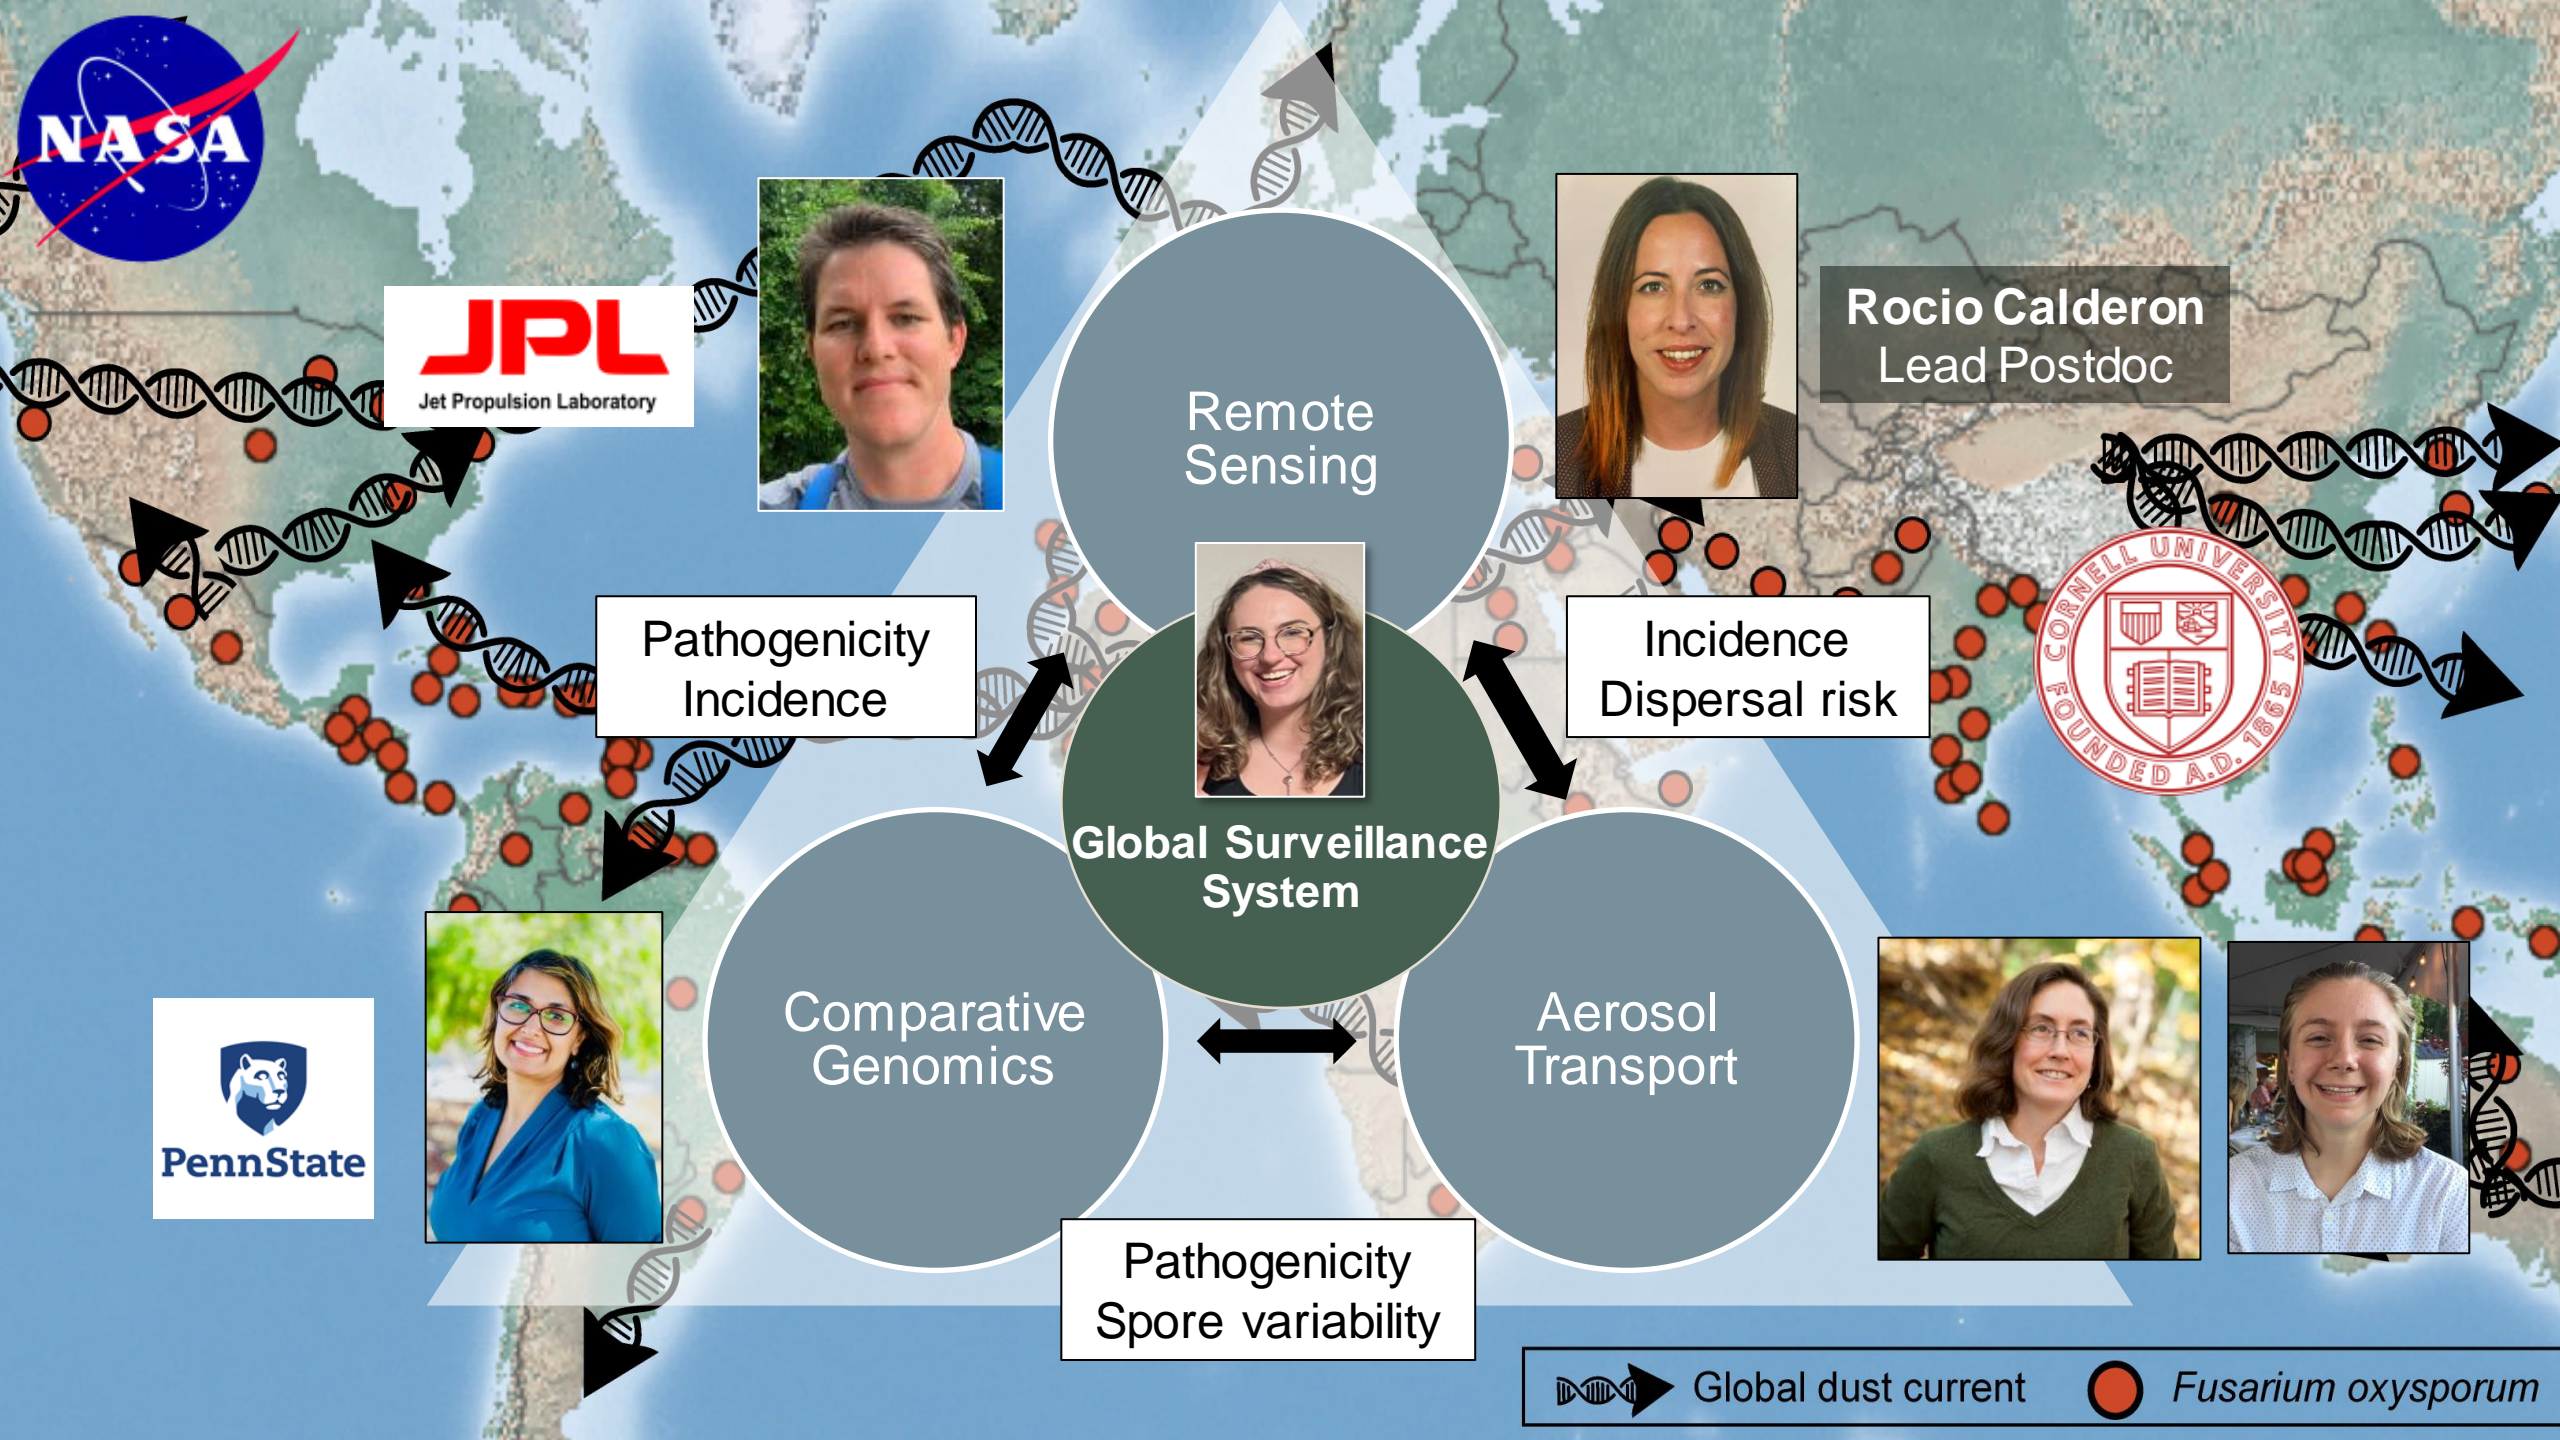

Fusarium oxysporum (Fo)

- Causes Fusarium Wilt (FW) in 100+ hosts
- Survives in soil for 20+ years
- Annual yield losses ~10-60%
- Range expansion expected with climate change (Shabani et al. 2014)
- **Preserving existing agroecosystems is critical to preserving natural ecosystems and global biodiversity**

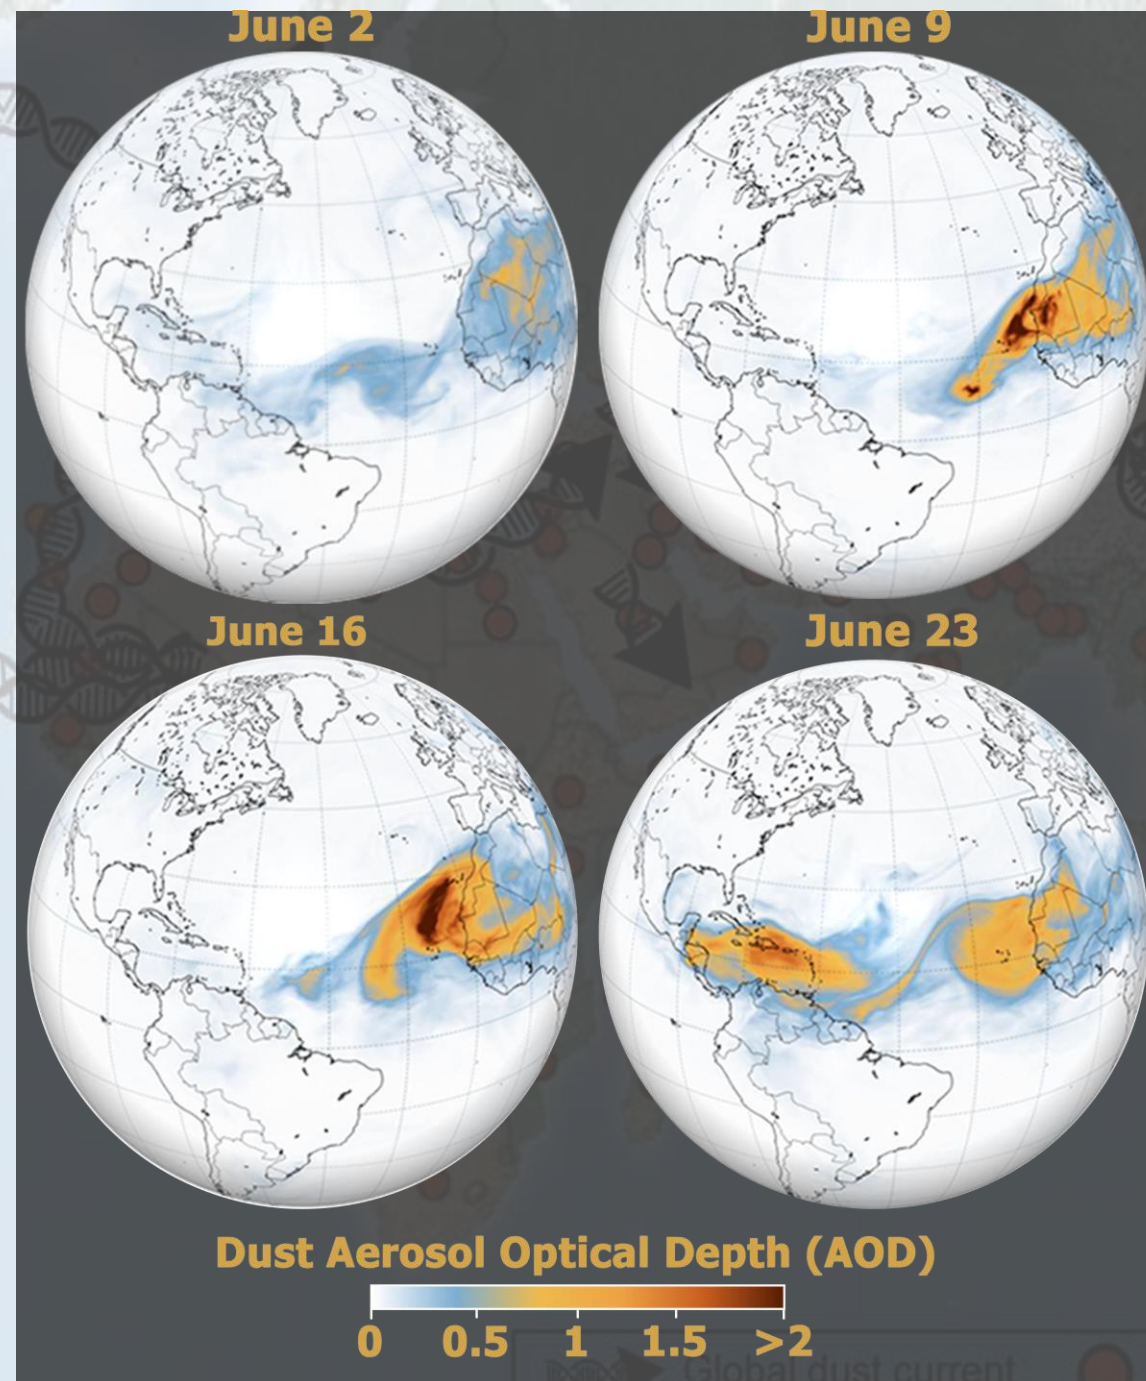

Aerosol Transport

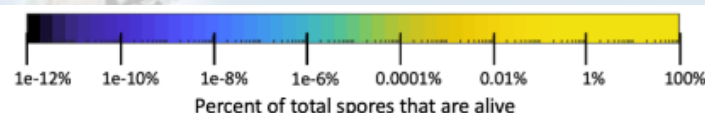

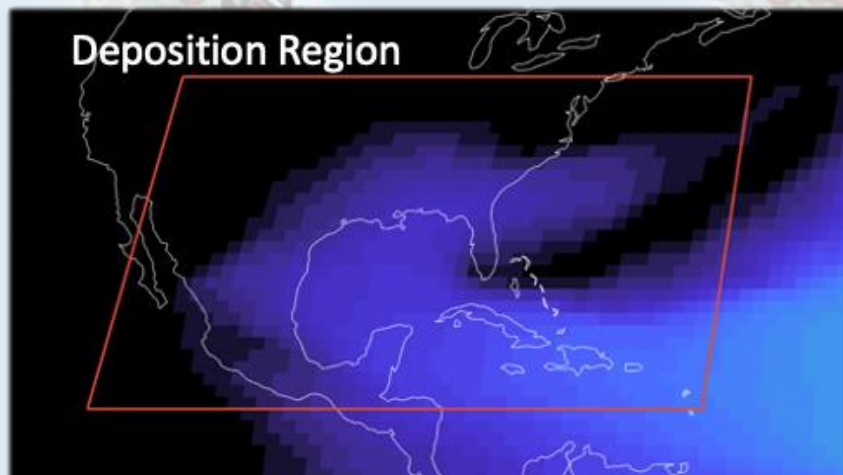

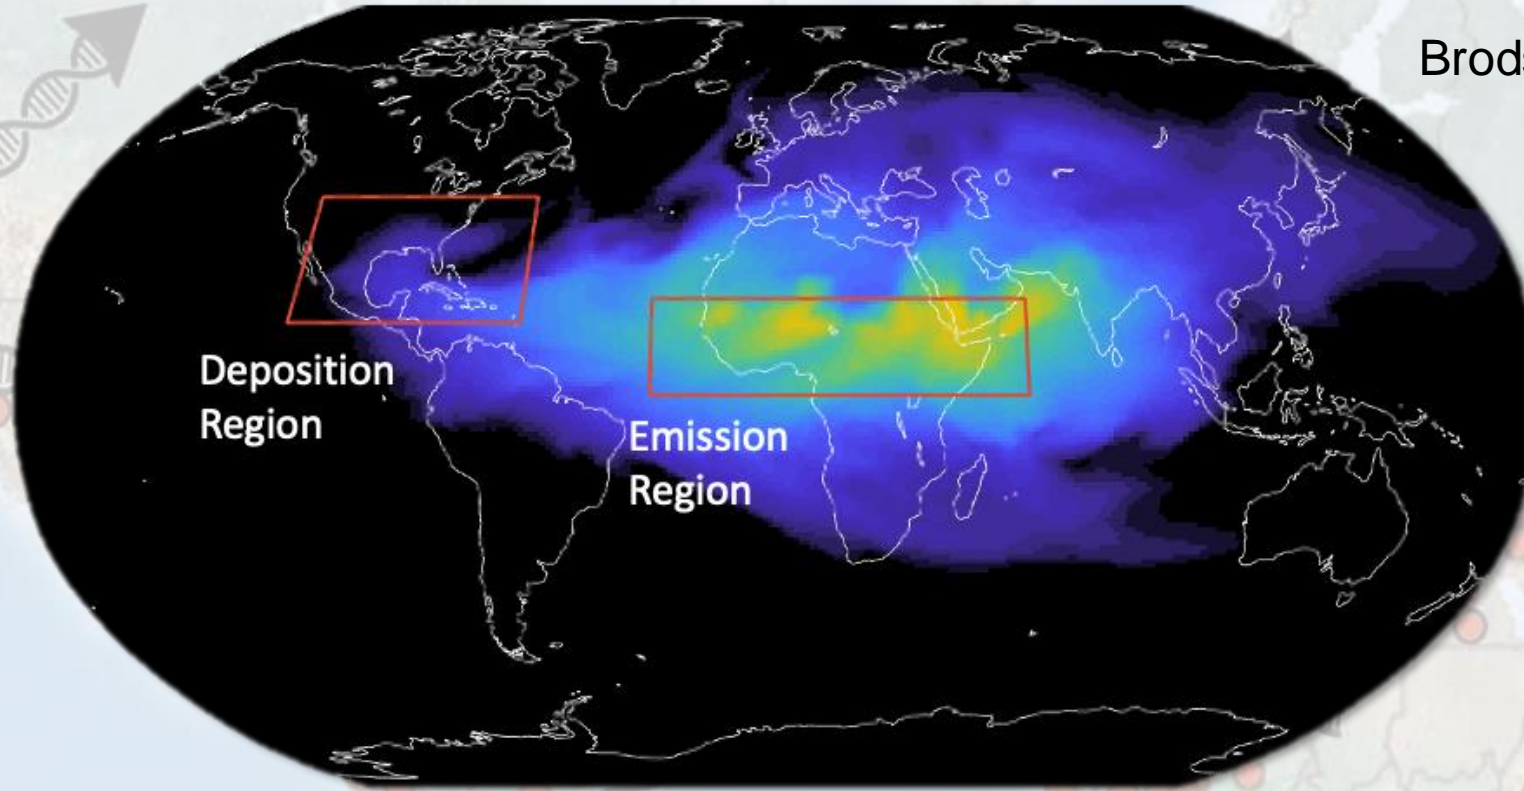

Build a model of long-distance atmospheric *Fo* spore transport and assess the likelihood of transatlantic transport of viable spores

In order to ask “**Can viable *Fo* spores be transported across the Atlantic?**”

We first had to....

- 1) ...accurately simulate the “Godzilla” dust event of Summer 2020
- 2) ...adapt the CESM-CAM6-MIMI to include **agricultural dust**
- 3) ...adapt the step 2 model to include **spore transport** with uniform concentration and fixed properties (e.g. size, weight) and an exponential decay function to kill off 99% of spores in 3 days

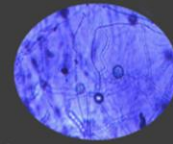

Almost all spores lose viability before reaching Americas.... **but not all!**

- Our model indicates that **~4 million live spores** could have been deposited in North America in June 2020
- Theoretically, if there is substantial fungal infestation in North Africa, a big dust event like Godzilla could carry millions of live spores to the Americas.
- Collaborating to assess dust samples for *Fo fsp* presence

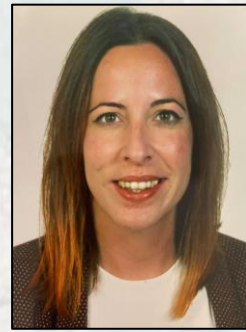

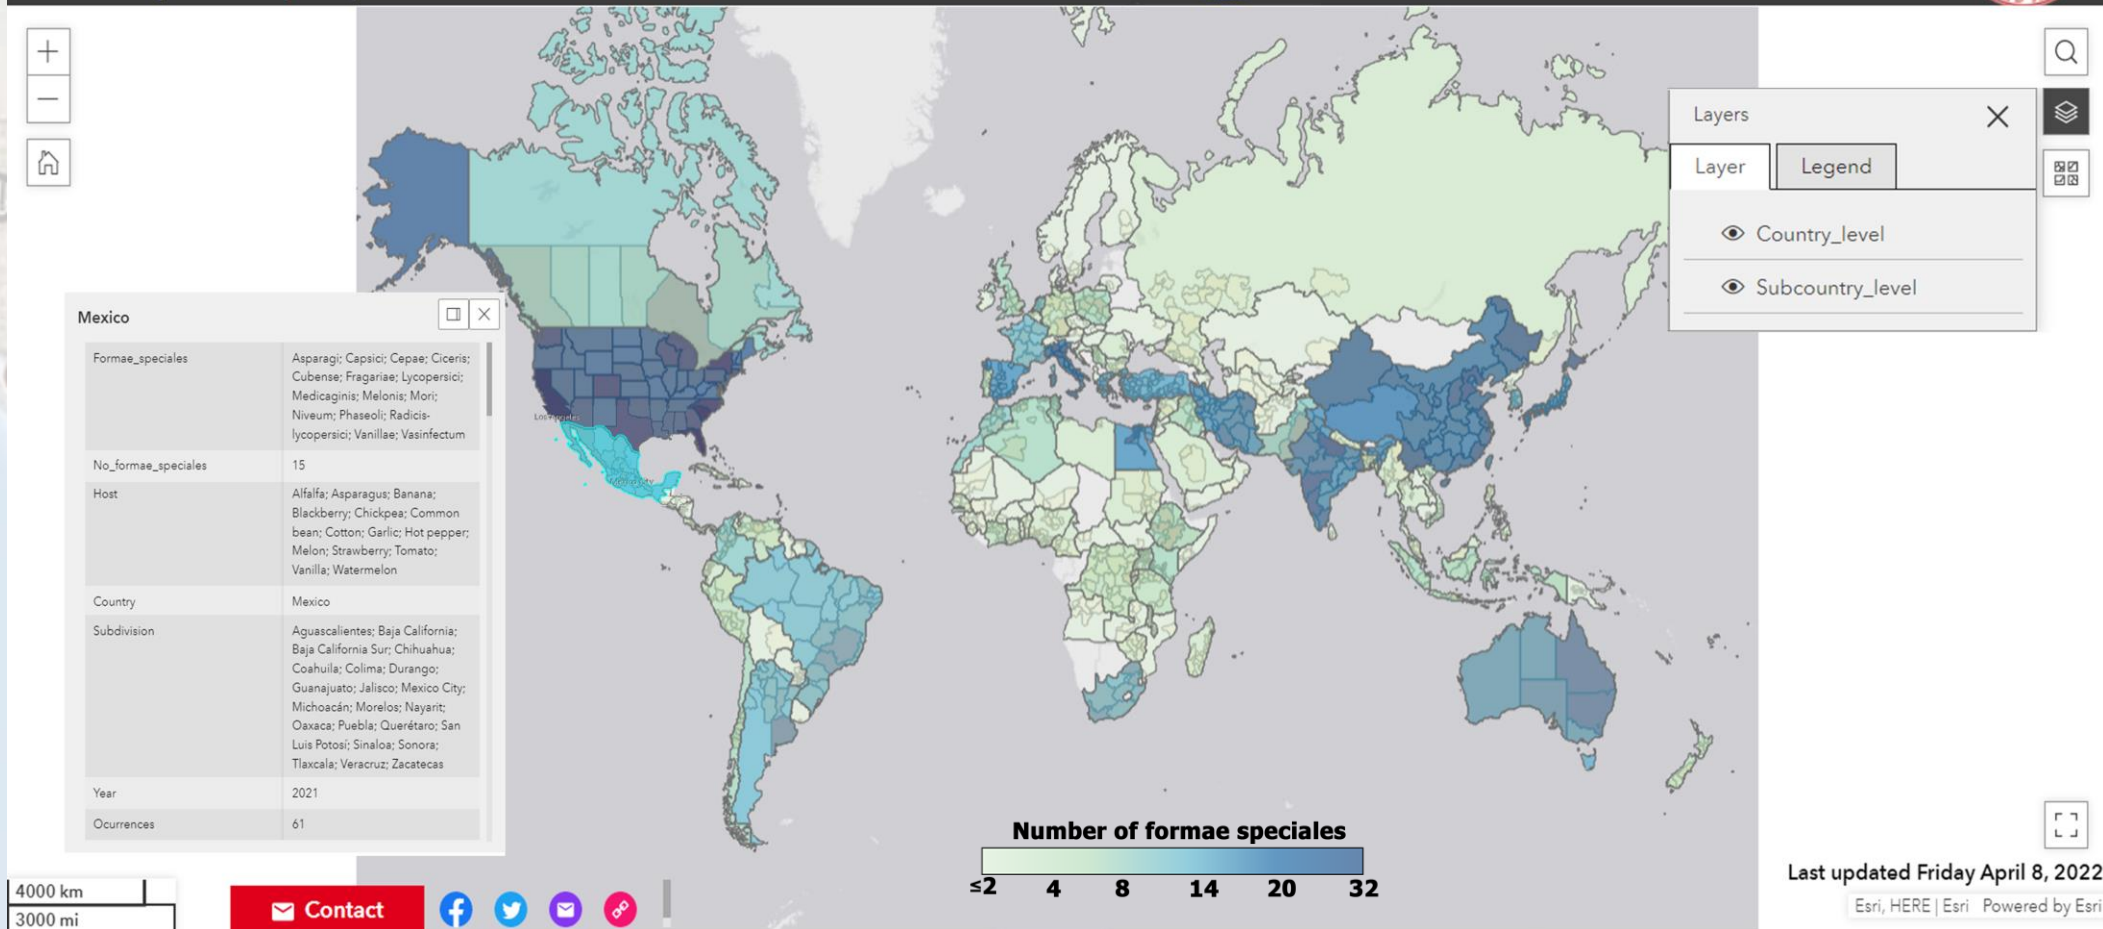

Fusarium oxysporum ff. spp. diversity and distribution

Fusarium oxysporum ff. spp.

This web map was developed as part of NASA Grant #80NSSC20K1533

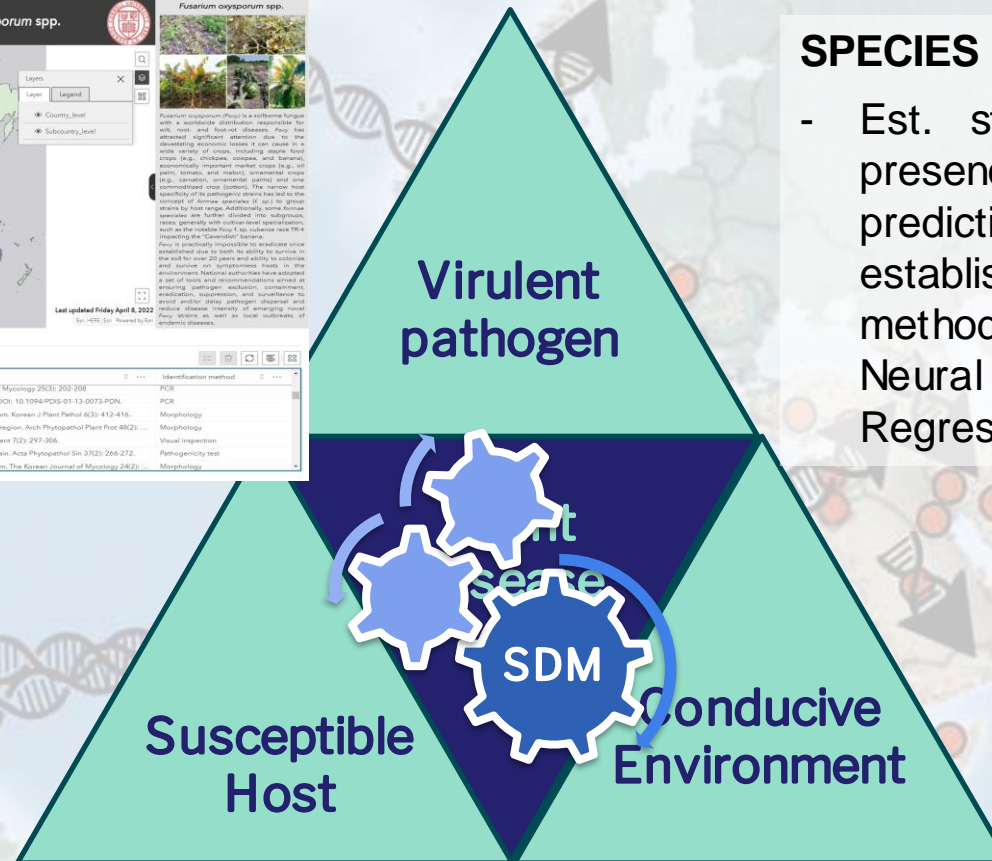

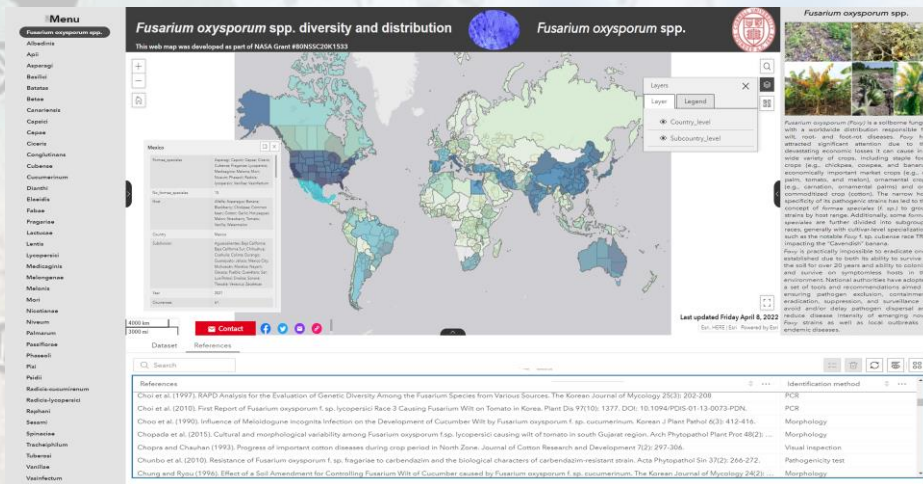

Remote Sensing

Build susceptibility assessment for current *Fo* risk in agricultural zones from remote sensing measurements

Calderón, R., Eller, J., Brodsky, H., Miles A., Crandall, S., Mahowald, N., Pavlick, R., and Gold, K. (in press). An interactive, online web map resource of global *Fusarium oxysporum* ff. spp. diversity and distribution. *Plant Disease*.

SPECIES DISTRIBUTION MODELS (SDM)

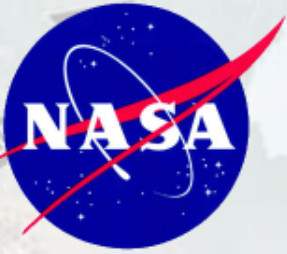

- Est. statistical relationships between species presence and agro-environmental variables, thus predicting the geographical suitability for its establishment. Based on machine-learning methods: MaxEnt (Maximum Entropy), Artificial Neural Networks, Random Forests, Boosted Regression Trees and Support Vector Machines.

Pathosystem Distribution Modeling

Based on Species Distribution Modeling

Fusarium oxysporum Global Surveillance System

● 1st year
□ 2nd year
● 3rd year

Remote Sensing

Build susceptibility assessment for current *Fo* risk in agricultural zones from remote sensing measurements

Compare relatedness between source/deposition isolates

Comparative Genomics

Assemble spore traits that impact dispersal and atmospheric viability

Climate change impacts on *Fo* distribution

Evaluate concordance between susceptibility assessment, known incidence and modeled dust sources/deposition regions

Aerosol Transport

Build a model of long-distance atmospheric *Fo* spore transport and assess the likelihood of transatlantic transport of viable spores

Incorporate spore variability by region into the atmospheric transport model

Thanks!
